Teen Driving: Drugged? Drunk? Distracted?

Fact Sheet

Each day in this country, as many as 9,000 16- and 17-year-old drivers get behind the wheel of a car. With this responsibility comes great risk: Driving-age teenagers have the highest overall crash rates of any age group, and traffic crashes are the leading cause of death for 15- to 20-year-olds. Drugs, alcohol, and driver distractions increase teens’ crash risks. As teens take to the roads, parents can take action by talking about the dangers of drunk, drugged, and distracted driving.

Teens are just as likely to drive under the influence of marijuana as alcohol.

- Thirteen percent of high school seniors reported driving under the influence of marijuana, a number nearly equivalent to those who reported driving under the influence of alcohol (14%), despite higher prevalence of alcohol consumption among teens.
- High school students are more likely to drink, smoke cigarettes, and smoke marijuana in the month immediately after earning their driver’s license.
- Thirteen percent of 12th graders reported that they usually smoke marijuana in a car, and eight percent reported that they usually drink beer in a car.
- In 2006, 30 percent of high school seniors reported driving after drinking heavily or using drugs, or riding in a car whose driver had been drinking heavily or using drugs, at least once in the prior two weeks.
- Thirty-eight percent of teens report seeing passengers smoking pot in a car with a teen driver.

Teen drivers admit to engaging in risky driving behaviors, which are more likely to cause crashes.

- Sixty-one percent of 16- and 17-year-olds admitted risky driving habits. Of that 61 percent, nearly 46 percent sent text messages while driving; 51 percent talked on cell phones while driving; 58 percent drove with their friends in the car; and 40 percent exceeded the speed limit by 10 miles per hour or more.
- More than one in four teens believes speeding, talking on a cell phone while driving, and not wearing a safety belt are safe.
- Even with a parent in the car, teens engage in bad driving choices, such as speeding (almost 50% of the time), talking on their cell phones while driving (about 20% of the time), and eating or drinking while driving (almost 20% of the time).
- Across all ages, driver inattention is the main cause of crashes. Nearly 80 percent of crashes and 65 percent of near-crashes involved driver inattention caused by some sort of distraction within three seconds of the event.

Risky driving behaviors are also a concern for Hispanic and African American teens, with both groups reporting driving or riding in a car with an impaired driver.

- Traffic crashes are the leading cause of death for Hispanic driving-age teens, and the second leading cause of death for African American driving-age teens.
According to the Johns Hopkins School of Public Health Center for Injury Research and Policy, African American males ages 13-19 are nearly twice as likely to die in a motor vehicle crash as males in general.\textsuperscript{15}

Among youth ages 12-17 in 2006, the rate of current illicit drug use among African Americans was similar to that of white teens (10%), while Hispanic teens reported slightly lower rates (9%) of current use.\textsuperscript{16}

Compared to white students, Hispanic 12\textsuperscript{th} graders had lower rates of driving after marijuana use, and black 12\textsuperscript{th} graders had lower rates of driving after drinking heavily. However, both Hispanic 12\textsuperscript{th} graders and black 12\textsuperscript{th} graders were just as likely as white 12\textsuperscript{th} graders to report driving or riding in a car with a driver who had been drinking heavily or using drugs.\textsuperscript{17}

Parents are the most important influence on their teen when it comes to risky behaviors, including substance abuse and driving. Parents can improve their teen’s health and safety by discussing the dangers of using drugs or alcohol at any time, setting a good example behind the wheel, establishing driving rules and consequences, teaching them to eliminate distractions when operating a motor vehicle, and warning them of the dangers of riding with impaired or distracted drivers.

Despite what most parents think, teens value their advice. More than half of teens of all ages (57%) say that family, rather than friends or school, is the most important thing in their lives right now.\textsuperscript{18}

Teens who report having conversations with their parents about alcohol and drug use are more likely to stay drug-free, compared to teens who do not talk about substance abuse with their parents.\textsuperscript{19}

Nearly 60 percent of teens who drive say their parents have the most influence on their driving.\textsuperscript{20} Yet, teens have reported seeing their own parents talking on a cell phone while driving (62%), speeding (48%), and not wearing a safety belt (31%).\textsuperscript{21}

Sixty-six percent of teens say they care about their parents’ opinion on cell phone use while driving.\textsuperscript{22}

Teens whose parents enforce penalties for driving law infractions are more likely than teens whose parents do not enforce penalties to wear their safety belts (89% vs. 74%); require their passengers to buckle up (82% vs. 64%); obey stop signs (91% vs. 60%); and use turn signals (89% vs. 76%).\textsuperscript{23}
